## Oral Abstract Q-175

19 ${ }^{\text {th }}$ Conference on Retroviruses and Opportunistic Infections (CROI)
Seattle, WA
March 6, 2012

## Study Design

- Two-arm study, double-blinded for BOC, open-label for PEG2b/RBV
- 2:1 randomization (experimental: control)
- Boceprevir dose 800 mg TID
- 4-week lead-in with PEG2b/RBV for all patients
- PEG-2b $1.5 \mu \mathrm{~g} / \mathrm{kg}$ QW; RBV 600-1400 mg/day divided BID
- Control arm patients with HCV-RNA $\geq$ LLOQ at TW 24 were offered open-label PEG2b/RBV+BOC via a crossover arm

## Demographics and Baseline Characteristics

|  | $\begin{gathered} \text { PR } \\ (\mathrm{N}=34) \end{gathered}$ | $\begin{gathered} B / P R \\ (N=64) \end{gathered}$ |
| :---: | :---: | :---: |
| Age (years), mean (SD) | 45 (9.8) | 43 (8.3) |
| Male, n (\%) | 22 (65) | 46 (72) |
| Race, n (\%) |  |  |
| White | 28 (82) | 52 (81) |
| Non-white | 6 (18) | 12 (19) |
| Body mass index, mean (SD) | 26 (4) | 25 (4) |
| Cirrhosis, n (\%) | 1 (3) | 4 (6) |
| HCV genotype subtype, n (\%)* |  |  |
| 1 a | 22 (65) | 42 (66) |
| 1b | 10 (29) | 15 (23) |
| HCV RNA level >800,000 IU/mL, n (\%) | 30 (88) | 56 (88) |
| HIV RNA <50 copies/mL, n (\%) | 33 (97) | 62 (97) |
| CD4 count (cells/mm ${ }^{3}$ ), median (range) | 586 (187-1258) | 577 (230-1539) |

## Virologic Response Over Time ${ }^{\dagger}$

† Three patients undetectable at FW4 have not yet reached FW12 and were not included in SVR12 analysis.

## Summary of Safety

|  | PR <br> $(\mathrm{N}=34)$ | $\mathrm{B} / \mathrm{PR}$ <br> $(\mathrm{N}=64)$ |
| :--- | :---: | :---: |
| Any AE | $34(100)$ | $63(98)$ |
| Serious AEs | $7(21)$ | $11(17)$ |
| Death | 0 | 0 |
| Treatment-related treatment-emergent | $34(100)$ | $61(95)$ |
| AEs | $3(9)$ | $13(20)$ |
| Study discontinuation due to an AE | $8(24)$ | $18(28)$ |
| Any drug modification due to an AE |  |  |

All data shown as number (\%) of patients.

## Most Common Adverse Events With a Difference of $\geq 10 \%$ Between Groups

|  | PR <br> $(\mathbf{N}=34)$ | $\mathbf{B / P R}$ <br> $(\mathbf{N}=64)$ |
| :--- | :---: | :---: |
| Anemia | $26 \%$ | $41 \%$ |
| Pyrexia | $21 \%$ | $36 \%$ |
| Asthenia | $24 \%$ | $34 \%$ |
| Decreased appetite | $18 \%$ | $34 \%$ |
| Diarrhea | $18 \%$ | $28 \%$ |
| Dysgeusia | $15 \%$ | $28 \%$ |
| Vomiting | $15 \%$ | $28 \%$ |
| Flu-like illness | $38 \%$ | $25 \%$ |
| Neutropenia | $6 \%$ | $19 \%$ |

## Interim Analysis Summary

- HCV-HIV co-infected HCV treatment naïve patients had high rates of HCV response on BOC
- SVR-12. $61 \%$ of patients on B/PR vs. $27 \%$ of patients on PR
- Preliminary safety data of $\mathrm{B} / \mathrm{PR}$ in co-infected patients showed a profile consistent with that observed in mono-infected patients

## SVR Rates 12 Weeks Post-Treatment (SVR12*)

## HCV Treatment Outcome

|  | Total |  |
| ---: | :---: | :---: |
| Virologic Outcome | T/PR | PR |
| n/N (\%) | SVR | $28 / 38(74)$ |
| Patients without SVR | $10 / 38(26)$ | $12 / 22(55)$ |
| On-treatment virologic failure | $3 / 38(8)$ | $8 / 22(36)$ |
| Not suppressed at EOT | $5 / 37^{*}(14)$ | $9 / 22(41)$ |
| Patients with relapse | $1 / 32^{\S}(3)$ | $2 / 13(15)$ |
| Other | $6 / 38(16)$ | $2 / 22(3)$ |

Relapse was defined as HCV RNA $\geq$ LLOQ relative to the actual end-of-treatment (EOT) window. Number of patients with values <LLOQ at EOT visit window, or those whose next value observed after the actual EOT window is <LLOQ was used as denominator for relapse calculations. *N=37, 1 patient did not have EOT HCV RNA ${ }^{\text { }}$ T/PR patient from Part A

## Events of Special Interest: Overall Treatment Phase

|  | T/PR <br> $\mathrm{N}=38$ <br> $\mathrm{n}(\%)$ | PR <br> $\mathrm{N}=22$ <br> $\mathrm{n} / \mathrm{N}(\%)$ |
| :--- | :---: | :---: |
| Severe rash | $\mathbf{0 ( 0 )}$ | $\mathbf{0 ( 0 )}$ |
| Mild and moderate <br> rash | $13(34)$ | $5(23)$ |
| Anemia | $\mathbf{7 ( 1 8 )}$ | $\mathbf{4 ( 1 8 )}$ |
| Grade 3 hemoglobin <br> shifts* (7.0-8.9 g/dL) | $\mathbf{1 1 ( 2 9 )}$ | $5(23)$ |
| Use of erythropoietin <br> stimulating agent | $\mathbf{3 ( 8 )}$ | $\mathbf{1 ( 5 )}$ |
| Blood transfusions |  | $\mathbf{1 ( 5 )}$ |

-CD4 counts declined in both T/PR and PR groups; CD4\% remained unchanged

## Conclusions

- Higher SVR12 rates were observed in chronic genotype 1 HCV/HIV co-infected patients treated with telaprevir combination treatment
- T/PR 74\%
- PR 45\%
- In patients treated with telaprevir combination treatment, overall safety and tolerability profile was comparable to that previously observed in chronic genotype 1 HCV mono-infected patients

# Low Rates of Treatment Initiation and Completion of HCV Therapy in US VA System 

- Among individuals not receiving HCV therapy HIV coinfection cited as the reason for $6.3 \%$ Kramer JR, et al. J Hepatol. 2012;56:320-325.

## Issues with HCV Therapy Influencing Treatment Decisions in HIV

- Polypharmacy
- Side Effect Profile
- Interferon-based
- DDI

## PK Issues and

## Clinical Consequences

## Interactions Between HCV and HIV PIs Summary of Healthy Volunteer Studies

Impact on HIV PI Cmin Impact on HCV AUC

- Dosing recommendations:
- Boceprevir: coadministration with ritonavir-boosted Pls is not recommended
- Telaprevir: do not administer with DRVr, FPVr or LPVr; ongoing evaluation with ATVr

## Interactions Between HCV DAA \& EFV Summary of Healthy Volunteer Studies

## Impact on HCV PK

- Dosing recommendations:
- Boceprevir: coadministration EFV is not recommended
- Telaprevir: use 1125 mg TID with EFV

## Interactions Between HCV DAA \& NNRTIs Summary of Healthy Volunteer Studies

- Dosing recommendations:
- Efavirenz: avoid with BOC, use 1125 mg TID telaprevir
- Etravirine: ? with BOC, OK with telaprevir
- Rilpivirine: OK with telaprevir
[van Heeswijk et al. CROI 2011, \#119. Garg et al. 6th HCV PK Wksp 2011, \#PK_13. Victrelis Monograph 2011. Hammond et al. IWCPHT 2012 O-15. Kakuda et al. IWCPHT 2012 O_18]

## Integrase Inhibitors- Raltegrevir

|  |  |  |  | paired sample |  |
| :--- | :---: | :---: | :---: | ---: | ---: | ---: |
|  | RAL + BOC | RAL | GMR (90\% CI) | t-test |  |
| $\mathrm{AUC}_{0-12 \mathrm{~h}}\left(\mathrm{mg}^{*} \mathrm{~h} / \mathrm{L}\right)$ | $4.27(3.22-5.66)$ | $4.22(3.19-5.59)$ | 1.01 | $(0.85-1.20)$ | 0.664 |

Figure 2: Mean (SD) PK Profile of TVR

Figure 5: Mean (SD) PK Profiles of RAL-gluc

Van Heeswijk. ICAAC 2011. Poster \#1738

## Clinical Relevance

- Boceprevir
- 7 patients had HIV breakthrough (>50 copies HIV RNA at 2 consecutive visits):
- 3/64 randomized to B/PR
- $4 / 34$ to PR
- Telaprevir
- There were no HIV RNA breakthroughs
- 3 T/PR patients experienced HCV RNA breakthrough:
- 1 receiving EFV/TDF/FTC and 1 receiving ATV/r + TDF/FTC at W4
- 1 receiving EFV/TDF/FTC at W12

## Issues with HCV Therapy Influencing Treatment Decisions in HIV

- Expense
- Do the studies reflect your population?
- Complexity of delivery
- Lack of expertise
- Is this a true priority?

## When not to Treat?

- HIV Status
- Psychosocial-Economic Conditions currently exist to support treatment?
- Substance Abuse

## When to Treat?

- HIV in check
- Young and healthy without advanced liver disease
- Compensation but advanced fibrosis

## When to Treat?

- Sexual Transmission
- Acute Infection
- Vogel M, Dominguez S, Bhagani S, Azwa A, Page E, Guiguet M, Valantin MA, Katlama C, Rockstroh JK, Nelson M. Treatment of acute HCV infection in HIVpositive patients: experience from a multicentre European cohort. Antivir Ther. 2010;15(2):267-79.

## Present versus Future

## Research Needs

- Treatment of HIV-HCV co-infection in more advanced disease
- RGT
- IFN-sparing regimens
- DDI
- HCV treatment post OLT

## Concluding Statement

- The majority of issues are not unique to
- HIV-HCV co-infection.
- The same general approach to work-up, treatment and long-term follow-up is appropriate in this population as in HCV mono-infection.

## Thank You
